

EXERCISE-8

Aggregating Data Using Group Functions

NAME	PRATHESHA J
ROLL NO	241001172
DEPARTMENT	IT

4 .Find the highest, lowest, sum, and average salary of all employees. Label the columns Maximum, Minimum, Sum, and Average, respectively. Round your results to the nearest whole number

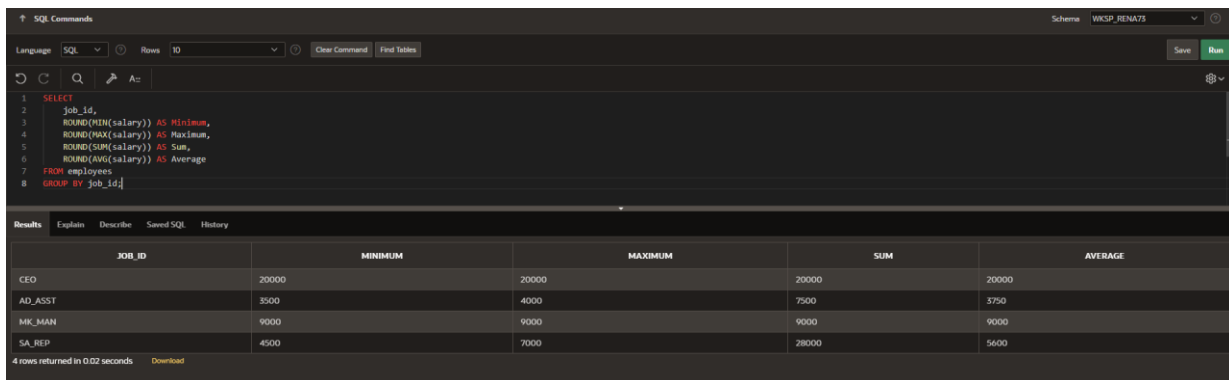

The screenshot shows a SQL query in a dark-themed editor. The query is:
`1 SELECT`
`2 ROUND(MAX(salary)) AS Maximum,`
`3 ROUND(MIN(salary)) AS Minimum,`
`4 ROUND(SUM(salary)) AS Sum,`
`5 ROUND(AVG(salary)) AS Average`
`6 FROM employees;`
 The results are displayed in a table with the following data:

MAXIMUM	MINIMUM	SUM	AVERAGE
20000	3500	64500	7167

1 rows returned in 0.02 seconds

5. Modify the above query to display the minimum, maximum, sum, and average salary for each job type.

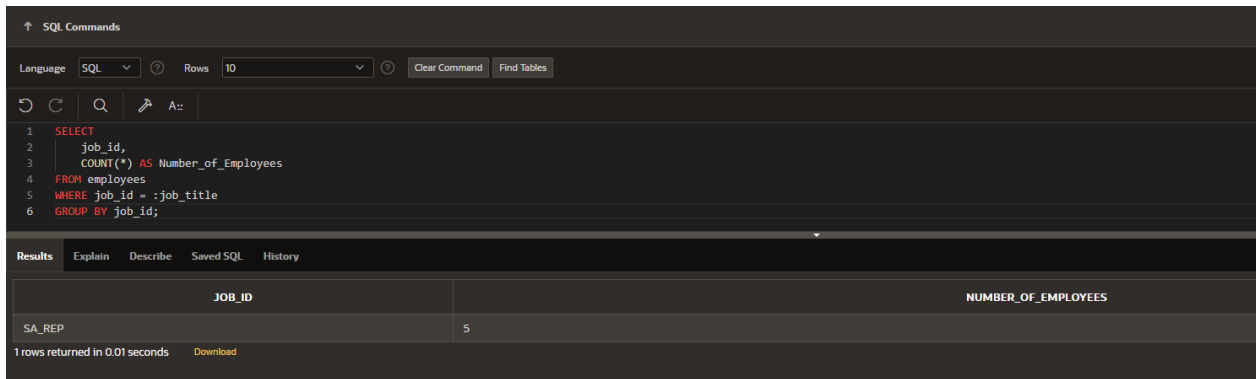

The screenshot shows a modified SQL query in a dark-themed editor. The query is:
`1 SELECT`
`2 job_id,`
`3 ROUND(MIN(salary)) AS Minimum,`
`4 ROUND(MAX(salary)) AS Maximum,`
`5 ROUND(SUM(salary)) AS Sum,`
`6 ROUND(AVG(salary)) AS Average`
`7 FROM employees`
`8 GROUP BY job_id;`
 The results are displayed in a table with the following data:

JOB_ID	MINIMUM	MAXIMUM	SUM	AVERAGE
CEO	20000	20000	20000	20000
AD_ASST	3500	4000	7500	3750
MR_MAN	9000	9000	9000	9000
SA_REP	4500	7000	28000	5600

4 rows returned in 0.02 seconds

6. Write a query to display the number of people with the same job. Generalize the query so that the user in the HR department is prompted for a job title.

The screenshot shows a SQL query in a dark-themed editor. The query is:
`1 SELECT`
`2 job_id,`
`3 COUNT(*) AS Number_of_Employees`
`4 FROM employees`
`5 WHERE job_id = :job_title`
`6 GROUP BY job_id;`
 The results are displayed in a table with the following data:

JOB_ID	NUMBER_OF_EMPLOYEES
SA_REP	5

1 rows returned in 0.01 seconds

7. Determine the number of managers without listing them. Label the column Number

of Managers. Hint: Use the MANAGER_ID column to determine the number of Managers.

The screenshot shows a SQL editor with the following query:

```
1 SELECT
2   COUNT(DISTINCT manager_id) AS Number_of_Managers
3 FROM employees
4 WHERE manager_id IS NOT NULL;
```

The results pane shows a single column header **NUMBER_OF MANAGERS** with a value of 4. The status bar indicates "1 rows returned in 0.00 seconds".

8. Find the difference between the highest and lowest salaries. Label the column DIFFERENCE.

The screenshot shows a SQL editor with the following query:

```
1 SELECT
2   ROUND(MAX(salary) - MIN(salary)) AS DIFFERENCE
3 FROM employees;
```

The results pane shows a single column header **DIFFERENCE** with a value of 16500. The status bar indicates "1 rows returned in 0.01 seconds".

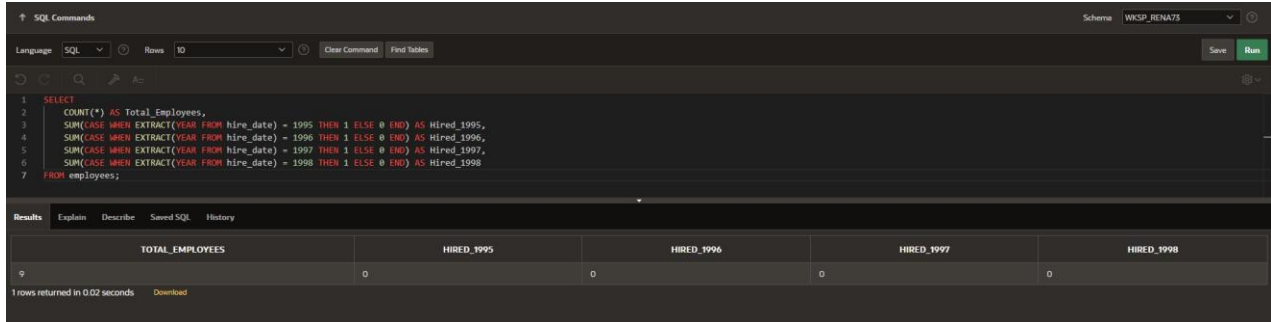

9. Create a report to display the manager number and the salary of the lowest-paid employee for that manager. Exclude anyone whose manager is not known. Exclude any groups where the minimum salary is \$6,000 or less. Sort the output in descending order of salary.

The screenshot shows a SQL editor with the following query:

```
1 SELECT
2   manager_id,
3   ROUND(MIN(salary)) AS Lowest_Salary
4 FROM employees
5 WHERE manager_id IS NOT NULL
6 GROUP BY manager_id
7 HAVING MIN(salary) > 6000
8 ORDER BY Lowest_Salary DESC;
```

The results pane shows a table with two columns: **MANAGER_ID** and **LOWEST_SALARY**. The first row shows a manager ID of 102 with a lowest salary of 7000. The status bar indicates "1 rows returned in 0.01 seconds".

10. Create a query to display the total number of employees and, of that total, the number of employees hired in 1995, 1996, 1997, and 1998. Create appropriate column headings.

The screenshot shows a SQL Command window with the following query:

```

1 SELECT
2     COUNT(*) AS Total_Employees,
3     SUM(CASE WHEN EXTRACT(YEAR FROM hire_date) = 1995 THEN 1 ELSE 0 END) AS Hired_1995,
4     SUM(CASE WHEN EXTRACT(YEAR FROM hire_date) = 1996 THEN 1 ELSE 0 END) AS Hired_1996,
5     SUM(CASE WHEN EXTRACT(YEAR FROM hire_date) = 1997 THEN 1 ELSE 0 END) AS Hired_1997,
6     SUM(CASE WHEN EXTRACT(YEAR FROM hire_date) = 1998 THEN 1 ELSE 0 END) AS Hired_1998
7 FROM employees;

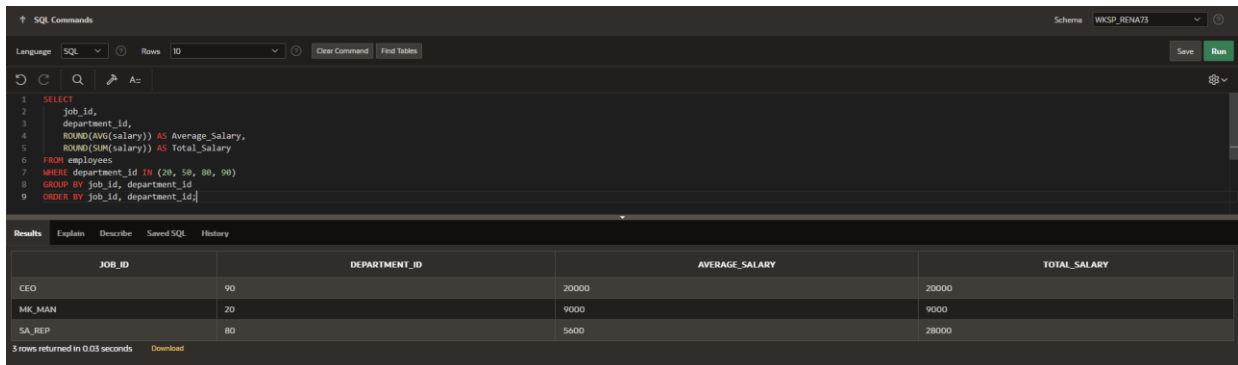

```

The results table shows the following data:

TOTAL_EMPLOYEES	HIRE_1995	HIRE_1996	HIRE_1997	HIRE_1998
9	0	0	0	0

1 rows returned in 0.02 seconds

11. Create a matrix query to display the job, the salary for that job based on department number, and the total salary for that job, for departments 20, 50, 80, and 90, giving each column an appropriate heading.

The screenshot shows a SQL Command window with the following query:

```

1 SELECT
2     job_id,
3     department_id,
4     ROUND(AVG(salary)) AS Average_Salary,
5     ROUND(SUM(salary)) AS Total_Salary
6 FROM employees
7 WHERE department_id IN (20, 50, 80, 90)
8 GROUP BY job_id, department_id
9 ORDER BY job_id, department_id;

```

The results table shows the following data:

JOB_ID	DEPARTMENT_ID	AVERAGE_SALARY	TOTAL_SALARY
CEO	90	20000	20000
MR_MAN	20	9000	9000
SA_REP	80	5600	28000

3 rows returned in 0.03 seconds

12. Write a query to display each department's name, location, number of employees, and the average salary for all the employees in that department. Label the column name-Location, Number of people, and salary respectively. Round the average salary to two decimal places.

SQL Commands

Schema: WWSJ_RENA7S
